

Drilling

Leitz Lexicon Edition 7

Version 2

02/2025

Explanation of abbreviations

A	= dimension A
a_e	= cutting thickness (radial)
a_p	= cutting depth (axial)
ABM	= dimension
APL	= panel raising length
APT	= panel raising depth
AL	= working length
AM	= number of knives
AS	= anti sound (low noise design)

b	= overhang
B	= width
BDD	= thickness of shoulder
BEM	= note
BEZ	= description
BH	= tipping height
BO	= bore diameter

CNC	= Computerized Numerical Control
-----	----------------------------------

d	= diameter
D	= cutting circle diameter
D0	= zero diameter
DA	= outside Diameter
DB	= diameter of shoulder
DFC	= Dust Flow Control (optimised chip clearance)
DGL	= number of links
DIK	= thickness
DKN	= double keyway
DP	= polycrystalline diamond
DRI	= rotation

FAB	= width of rebate
FAT	= depth of rebate
FAW	= bevel angle
FLD	= flange diameter
f_z	= tooth feed
$f_{z\text{ eff}}$	= effective tooth feed

GEW	= thread
GL	= total length
GS	= Plunging edge

H	= height
HC	= tungsten carbide, coated
HD	= wood thickness (thickness of workpiece)
HL	= high-alloyed tool steel
HS	= high-speed steel (HSS)
HW	= tungsten carbide (TCT)

ID	= ident number
IV	= insulation glazing

KBZ	= abbreviation
KLH	= clamping height
KM	= edge breaker
KN	= single keyway
KNL	= combination pinhole consists of 2/7/42 2/9/46,35 2/10/60

L	= length
I	= clamping length
LD	= left hand twist
LEN	= Leitz standard profiles

LH	= left hand rotation
----	----------------------

M	= metric thread
MBM	= minimum order quantity
MC	= multi-purpose steel, coated
MD	= thickness of knife
min^{-1}	= revolutions per minute (RPM)
MK	= morse taper
m min^{-1}	= metres per minute
m s^{-1}	= metres per second

n	= RPM
n_{max}	= maximum permissible RPM
NAL	= position of hub
ND	= thickness of hub
NH	= zero height
NL	= cutting length
NLA	= pinhole dimensions
NT	= grooving depth

P	= profile
POS	= cutter position
PT	= profile depth
PG	= profile group

QAL	= cutting material quality
-----	----------------------------

R	= radius
RD	= right hand twist
RH	= right hand rotation
RP	= radius of cutter

S	= shank dimension
SB	= cutting width
SET	= set
SLB	= slotting width
SLL	= slotting length
SLT	= slotting depth
SP	= tool steel
ST	= Cobalt-basis cast alloys, e.g. Stellite®
STO	= shank tolerance
SW	= cutting angle

TD	= diameter of tool body
TDI	= thickness of tool
TG	= pitch
TK	= reference diameter

UT	= cutting edges with irregular pitch
----	--------------------------------------

V	= number of spurs
v_c	= cutting speed
v_f	= feed speed
VE	= packing unit
VSB	= adjustment range

WSS	= workpiece material
-----	----------------------

Z	= number of teeth
ZA	= number of fingers
ZF	= tooth shape (cutting edge shape)
ZL	= finger length

Notes to the Lexicon concerning the diagrams and tables

The statements made in the diagrams and tables relate to specific conditions and represent parameters from tests subjected to defined conditions. Variations when using tools in individual case due to special application conditions may be possible. Our support team will provide you with detailed information.

6. Drilling

6. Drilling

6.1 Dowel drilling

Application	To drill tear-free dowel holes and blind holes.		
Workpiece material	Softwood and hardwood. Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc. Laminated veneer lumber (plywood, multiplex plywood, glued lumber etc.). Plastomers.		
Machine	Through feed drilling machines, Point-to-point drilling machines, CNC Machining centres, Hinge boring machines, Special purpose drilling machines.		
Design	Two dowel drill designs available:		
			1. Design without heel Optimised dowel drill for machining panels in the furniture industry. Minimum friction and feed forces as the flute has a smaller diameter. A loose countersink can be clamped on the shank.
			
			2. Design with heel Dowel drills with heel are used to drill holes in solid wood and for machines with insufficient guidance during drilling and return stroke. The drill has better guidance during the return stroke to prevent tear-outs at the edge. A loose countersink can be clamped on the heel and allows adjustment of the drilling and countersink depth.
			
Shank	Dowel drills usually have a shank diameter $d = 10$ mm. Drilling machines with only a small pitch between the drilling spindles may use dowel drills with a shank diameter $d = 8$ mm. Additionally, it is possible to mount the dowel drills directly on the drilling spindles with a threaded adaptor. Adaptors are available with different combinations of threads and either cylindrical or tapered seatings. Special shank dimensions available on request.		

6. Drilling

6.1 Dowel drilling

Technical features

The dimensions listed in the tool tables refer to the following tool parameters:

D	Drill diameter
d	Shank diameter
I	Shank length
NL	Working length = possible drilling depth
GL	Total length of the drill including the projection of the centre point
L	Total length of the drill excluding the projection of the centre point

Application data

RPM/feed speeds

The optimum RPM and feed speeds are detailed in the diagrams attached to the tool tables. Identification of the rotation: RH - black; LH - red.

Information

The existing allen screws in the shanks must be replaced by the length setting screw ID **009157** when using dowel drills in Leitz quick-change drill adaptors.

Shank 8 mm

Application:

For drilling blind holes, particularly dowel holes in furniture construction. Recommended on drill spindles with limited rigidity.

Machine:

Point-to-point drilling machines, through feed drilling machines, CNC machining centres, hinge boring machines, multi spindle units.

Workpiece material:

Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.).

Design with heel

Feed speed v_f depending on the spindle RPM n

Workpiece material:

Chipboard plastic coated

Operation:

Drilling

Correction factor for v_f :

Veneered = 0.8

Paper coated = 0.8

MDF, solid wood = 0.7

Chipboard, uncoated = 1.3

Technical information:

Spur geometry with shear cut. Drills can be combined with countersink WB 701 0 03. Countersink fixed on heel. Continuously adjustable boring and countersink depth. Good guidance on return stroke for tear-free holes.

RPM: $n = 3000 - 9000 \text{ min}^{-1}$

Boring bit mounted in reducing chucks

Boring bit with threaded shank mounted directly in the boring spindle

Length comparison: Dowel drills with threaded shank have a deeper boring depth than a comparable boring bit with cylindrical shank mounted in drill adaptors while having a lower overhang A with regard to the boring spindle.

Feed speed v_f depending on the spindle RPM n

Workpiece material:

Chipboard plastic coated

Operation:

Drilling

Correction factor for v_f :

Veneered = 0.8

Paper coated = 0.8

MDF, solid wood = 0.7

Chipboard, uncoated = 1.3

Shank 10 mm, HW tipped

Application:

For drilling blind holes, particularly dowel holes in furniture construction. Suitable for drilling tear-free blind holes in visible areas and for machining panel materials which are covered with laminations difficult to machine (e.g. thin decorative paper).

Machine:

Point-to-point drilling machines, through feed drilling machines, CNC machining centres, hinge boring machines, multi spindle units.

Workpiece material:

Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.).

HW

Design without heel

Feed speed v_f depending on the spindle RPM n

Workpiece material:

Chipboard plastic coated

Operation:

Drilling

Correction factor for v_f :

Veneered = 0.8

Paper coated = 0.8

MDF, solid wood = 0.7

Technical information:

Spur geometry with high shear cut. High wear resistant tungsten carbide grade for maximum life time. Drills can be combined with countersink WB 701 0 02.

Countersinks can be clamped on the shank. Recessed flute for minimised friction and feed forces.

RPM: $n = 3000 - 9000 \text{ min}^{-1}$

Note:

When using the bore pins in hardwood and glulam, the potential bore depth is restricted. Interim chip removal (return stroke) then is obligatory.

Boring pins require more power compared to dowel drills. The maximum number of boring pins, used in one drilling unit, depends on the power of the machine.

6. Drilling

6.2 Through hole drilling

Application	To drill tear-free through holes in panels.										
Workpiece material	Softwood and hardwood. Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc. Laminated veneer lumber (plywood, multiplex plywood, glued lumber etc.). Plastomers.										
Machine	Through feed drilling machines, Point-to-point drilling machines, CNC machining centres, Hinge boring machines, Special purpose drilling machines.										
Design	<p>Two available through hole drill designs:</p> <p>1. Design without heel Optimised through hole drill for machining panels in the furniture industry. Minimum friction and feed forces as the flute has a smaller diameter. A loose countersink can be clamped on the shank.</p> <p>2. Design with heel Through hole drills with heel are used to drill holes in solid wood and for machines with insufficient guidance during drilling and return stroke. The drill has better guidance during the return stroke to prevent tear-outs at the edge. A loose countersink can be clamped on the heel and allows adjustment of the drilling and countersink depth.</p> <div>   </div>										
Shank	Through hole drills usually have a shank diameter $d = 10$ mm. Drilling machines with a small pitch between the drilling spindles may use drills with a shank diameter $d = 8$ mm.										
Technical features	<p>The dimensions listed in the tool tables refer to the following tool parameters:</p> <table border="1"> <tr> <td>D</td><td>Drill diameter</td></tr> <tr> <td>d</td><td>Shank diameter</td></tr> <tr> <td>l</td><td>Shank length</td></tr> <tr> <td>NL</td><td>Working length = possible drilling depth</td></tr> <tr> <td>GL</td><td>Total length of the drill</td></tr> </table>	D	Drill diameter	d	Shank diameter	l	Shank length	NL	Working length = possible drilling depth	GL	Total length of the drill
D	Drill diameter										
d	Shank diameter										
l	Shank length										
NL	Working length = possible drilling depth										
GL	Total length of the drill										
Application data	<p>RPM/feed rates The optimum RPM and feed speeds are detailed in the diagrams attached to the tool tables. Identification of rotation: RH - black; LH - red.</p>										
Application recommendation	<p>The drilling quality in brittle or low-adhesive surfaces can be improved when the feed speed is reduced as the drill breaks through the workpiece.</p> 										

6. Drilling

6.2 Through hole drilling

6.2.1 Through hole drills

Shank 10 mm

Application:

For drilling through holes, particularly in furniture construction.

Machine:

Point-to-point drilling machines, through feed drilling machines, CNC machining centres, hinge boring machines, multi spindle units.

Workpiece material:

Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.), elastomers.

Technical information:

Drills can be combined with countersink WB 701 0 02. Countersinks can be clamped on the shank. Recessed flute for minimised friction and feed forces.

Design without heel

Feed speed v_f depending on the spindle RPM n

Workpiece material:

Chipboard plastic coated

Operation:

Drilling

Correction factor for v_f :

Veneered = 0.8

MDF = 0.7

Chipboard, uncoated = 1.3

6. Drilling

6.3 Hinge drilling

Application	To drill tear-free hinge holes.
Workpiece material	Softwood and hardwood. Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc. Laminated veneer lumber (plywood, multiplex plywood etc.).
Machine	Through feed drilling machines, Point-to-point drilling machines, CNC machining centres, Hinge boring machines, Special purpose drilling machines.
Design	Two available hinge drill designs:

1. Design with centre point,
2 spurs and 2 spiral cutting edges
(Z 2/V 2). These drills are optimised for
machining standard panels in the
furniture industry.
Design with short tip for deep holes
in thin panels.

2. Design without centre point,
3 spurs and 3 spiral cutting edges
ground to a V point (Z 3/V 3). Recom-
mended when there is the risk of the
centre point marking or breaking
through the back of the panel, e.g.
when drilling a 13 mm deep hole in a
16 mm thick workpiece.

Shank	Hinge drills usually have a shank diameter of $d = 10$ mm.
--------------	--

6. Drilling

6.3 Hinge drilling

Technical features

The dimensions listed in the tool tables refer to the following tool parameters:

D	Drill diameter
d	Shank diameter
l	Shank length
L	Total length of the hinge drill excluding the projection of the centre point
GL	Total length of the hinge drill including the projection of the centre point

Application data

RPM feed speeds

The optimum RPM and feed speeds are detailed in the diagrams attached to the tool tables.

Shank 10 mm

Application:

For drilling hinge holes, particularly in furniture construction.

Machine:

Point-to-point drilling machines, through feed drilling machines, CNC machining centres, hinge boring machines, multi spindle units.

Workpiece material:

Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.).

Technical information:

Good centering in solid wood by protruding centre point.

Torx® 20		adaptors	

Shank 10 mm, short centre point

Application:

For drilling hinge holes, particularly in furniture construction, with increased lifetime and high-quality edge. Design for higher feed speed in comparison to boring bits with Z 2 / V 2.

Machine:

Point-to-point drilling machines, through feed drilling machines, CNC machining centres, hinge boring machines, multi spindle units.

Workpiece material:

Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.).

Technical information:

Round spur geometry for increased edge quality. Solid tungsten carbide design. High wear resistant tungsten carbide grade. Tear-free edges in panels with glued plastic edgebanders when used on main spindle, boring units as well as drilling machines.

Feed speed v_f depending on the spindle RPM n

Workpiece material:

Chipboard plastic coated

Operation:

Drilling

Correction factor for v_f :

Chipboard paper coated = 0.7

Chipboard veneered = 0.7

MDF plastic coated = 1.0

Glulam = 0.6

Solid wood = 1.0

Double hinge drill with pre-drill

Double hinge drills in aggregate

Shank 10 mm, double furniture hinge

Application:

For drilling hinges and pivots in window manufacturing in single or twin drill design.

Machine:

Stationary routers with/without CNC control, machining centres, special cutting machines to machine frame parts, drilling machines, multi spindle units.

Workpiece material:

Softwood and hardwood, modified timber for window construction, laminated veneer lumber (plywood, multiplex plywood etc.), glued lumber.

Technical information:

Round spur geometry for high edge quality. Solid tungsten carbide design (ID 037218 / 037219 TC-tipped). High wear resistant tungsten carbide grade. Minimum distance of drill spindle 22 mm. ID 037218 / 037219 with pre-drill for corner pivots with pilot pin.

Boring bit set, consisting of 1 pc. RH and LH

6. Drilling

6.3 Hinge drilling 6.3.4 Hinge drills, DP

Shank 10 mm

Application:

For drilling hinge holes, particularly in furniture construction with maximum durability. Specially for drilling materials with hard and abrasive coatings (e.g. HPL, CPL etc.).

Machine:

Point-to-point drilling machines, through feed drilling machines, CNC machining centres, hinge boring machines, multi spindle units.

Workpiece material:

Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., fire resistant particle and fibre materials, laminated veneer lumber (plywood, multiplex plywood etc.).

Feed speed v_f depending on the spindle RPM n

Workpiece material:

Chipboard plastic coated

Operation:

Drilling

Correction factor for v_f :

Veneered = 0.8

Paper coated = 0.8

MDF = 0.7

Technical information:

DP tipped for increased performance time compared to tungsten carbide. Suitability for high volume production. Diamaster PRO tipping, resharpenable two/three times with normal wear. Preferred used on automatic machines. Drills can only be used in column drilling machines when workpieces are clamped tightly.

Application To drill holes for the furniture industry and in timber frame construction.

Workpiece material
[recommended cutting material]
Softwood and hardwood.
Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc. [only HW].
Laminated veneer lumber (plywood, multiplex plywood etc.) [only HW].

Machine
Column drilling machines,
Drilling machines,
Special purpose drilling machines,
Portable drills.

Design

1. Twist drills

Twist drills with a centre point and spurs (Z 2/V 2) are used to drill holes deeper than possible with dowel drills.

There is a choice of cutting materials – SP, HS and HW. The matrix shows the recommended cutting material for the different workpiece materials:

	SP	HS	HW
Softwood, dry	◆	◆	◆
Softwood, wet	◆	◆	◇
Hardwood, dry	◇	◆	◆
Hardwood, wet	◇	◆	◇
Laminated wood (plywood, etc.)			◆
Chipboard and fibre materials			
- paper coated			◆
- plastic coated			◆
- veneered			◆
Solid wood, veneered			◆
◆ suitable ◇ partly suitable			

Tungsten carbide spiral drills are available with single or double heel. The design with double heel improves guidance during boring and return stroke and reduces the friction between flute and hole.

Solid tungsten carbide Z 2/V 2 design suitable for drilling deep holes in solid wood without interim clearance strokes and for high feed speeds.

Twist drill WB 121 0 32 with special cutting edge geometry for drill holes in HPL without break-outs on both sides.

2. Levin type drill

Levin type drills are used to drill deep holes. The key feature is a spiral flute with a large chip gullet cross section giving excellent chip clearance. With V point in HS, recommended for through hole drilling and drilling holes in end grain.

3. Cylinder head drills

Cylinder head drills are used to drill tear-free holes in solid wood, for blind holes, for hinge holes and holes for repair plugs.

Technical features

The dimensions listed in the tool tables refer to the following tool parameters:

D	Drill diameter
S	Shank diameter x shank length
NL	Working length = possible drilling depth
GL	Total length of the drill including the projection of the centre point

Application data

RPM/feed speeds

The optimum RPM and feed speeds are detailed in the diagrams attached to the tool tables.

**HW solid, Z 2****Application:**

For multi-purpose drilling of blind and through holes.

Machine:

Point-to-point drilling machines, through feed drilling machines, CNC machining centres, hinge boring machines, multi spindle units, column drilling machines, portable drills.

Workpiece material:

Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.), plastics (thermoplastic, fibre reinforced etc.), NF-metals (aluminium, copper etc.).

**Technical information:**

Flat V-point. Shank diameter identical to drill diameter. Convert for shank D 10 mm with reducing sleeve TB 110 0 or PM 320 0 25 (see following pages). Drilling in NF-metal requires suitable lubrication (spray mist or minimal lubrication).

**V-point 120°**

**HW solid, Z 2 / V 2, Marathon****Application:**

For drilling very deep holes without interim clearance strokes. Particularly suitable for drilling connection and dowel holes in timber frame and window construction.

Machine:

Stationary routers with/without CNC control, machining centres, special cutting machines to machine frame parts, column drilling machines, drilling machines, multi spindle units, portable drills.

Workpiece material:

Softwood and hardwood, modified timber for window construction, laminated veneer lumber (plywood, multiplex etc.), glued lumber.

Technical information:

Design in solid tungsten carbide, Z 2/V 2 and centre point. Marathon coating for increased performance time. Extra-long centre point for use of the drills at an angle. Very large gullets for perfect chip removal particularly when drilling in end grain. Shank design with reduced clamping area for good centering in shrink and collet chucks.

HW solid, Z 2, Marathon

Application:

To produce stepped holes, particularly for screwed hinge holes for doors.

Machine:

Multi spindle units, CNC machining centres, portable drills.

Workpiece material:

Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.).

Technical information:

HW solid design, Z 2, two-steps. Extra-long centre point for perfect positioning of the boring bits even on inclined surfaces. Marathon coating for increased performance time.

Drilling hole for screwed hinge at an inclined angle of 7° up to 9°

Feed speed v_f depending on the spindle RPM n

Workpiece material:

Chipboard plastic coated

Operation:

Step drilling

Correction factor for v_f :

MDF, solid wood = 0.7

Problem	Possible cause	Action
Drill wears quickly	– Feed rate per rotation too low	Increase feed rate or reduce RPM (see charts on product pages)
High wear to spurs	– Tool remains stationary at the reversal point when drilling dowel holes	Reduce RPM or increase acceleration of the feed axis (when possible) Change program
	– Abrasive workpiece material	Select drills with more wear resistant cutting edge material (HW or DP)
Uneven edges (new drill)	– Feed rate per rotation too high as the bit enters or leaves the workpiece	Reduce feed rate or increase RPM (see charts on product pages)
	– Insufficient concentricity of drill	Check concentric clamping of bit and chuck Check spindle and chuck for deformation
	– Insufficient centering on return stroke of the drill	Check spindle and chuck for signs of wear Use drills with heel
Chips and workpiece become hot	– Tool too long at the reversal point when drilling dowel holes	Reduce RPM or increase acceleration of the feed axis (when possible) Change program
Burn marks at the bore wall (new drill)	– Insufficient chip flow	Clear gullet from time to time when drilling deep holes. Select drill type for high chip volumes (e.g. Levin type)
Bore too large	– Error in concentricity or the centre-point is not central	Check boring bit clamping for concentricity. Check boring bit chuck and motor spindle for deformation and wear Check the concentric running of the centre point
Unclean countersunk wood	– Chips jammed between flute and loose countersink	Use one-piece stepped boring bit when machining solid wood
Broken drill	– Wrong application parameters	Reduce feed rate, increase RPM (see charts on product pages)
	– Bore is full of chips	Clear gullet from time to time when boring deep holes. Select boring bit type for large chip quantities (e.g. Levin type).
	– Non-uniform workpiece material	Check workpiece for foreign objects Reduce feed rate
	– Premature loosening of workpiece clamping	Adjust program
	– Worn drilling spindle	Check spindle bearing, repair if necessary
Broken spurs	– High feed rate when drilling hard workpiece materials	Reduce feed rate
	– Workpiece material not suitable for machining with spurs	Grind off spur and chamfer cutting edge at change-over to the minor cutting edge

Worn spurs (abrasive wear)

The natural end of the performance time of a dowel or hinge boring bit is determined by worn spurs by abrasion. The cutting forces on the workpiece surface increase with increasing wear. The surface is subject to severe deformation before it is cut.

Consequently, the edge of the boring hole arches. Coated panel materials will show tear-outs and veneered surfaces crack at the edge of the boring hole. The boring bit must be replaced.

The performance time is set by the quality requirement of the holes. With visible holes such as holes for shelves, drill replacement should be carried out earlier than for holes for dowel joints.

Worn spurs.

Broken spurs

The sharp and precise spurs of dowel and hinge boring bits are prone to mechanical overstress. They can break when used under unfavourable operating conditions.

This can be caused by worn spindles or chucks if the workpiece is not clamped firmly, or by hard foreign objects in the workpiece such as small stones or metal particles.

Broken spurs do not produce a clean cut since the break geometry is random. As a rule, this results in break-outs or tear-outs at the edge of the hole.

If the break geometry is favourable, the drilling quality does not deteriorate immediately. With continued use, these broken spurs are subject to fast abrasive wear. Performance times are considerably reduced. The wear can conceal the damaged spurs.

Broken spurs.

Thermal wear

Because of the permanent contact between the cutting edges and the workpiece material and the deep boring depth, operating conditions can occur which lead to heat stress.

Heat stress occurs when the heat developed by the friction at the main cutting edges cannot be dispersed by the chips. This can be caused by the wrong operating conditions such as high RPM at a low feed rate or when the boring bit remains stationary too long at the reversal point when boring dowel holes.

Insufficient chip removal at deep depths or resin build-up at the gullet can also lead to frictional heat.

The structure of the cutting material is destroyed thermally regardless of using HS, HW or DP. HS cutting materials overheat and lose hardness. The binding agent of sintered cutting materials such as HW or DP is attacked, grain breakage at the cutting edge can occur.

The cutting edges in the illustrations show the difference between abrasive wear (top) and wear caused by heat (bottom).
